# 4G/5G Converged Core Network in New York IDC

2022.10

**01 Test Environment**

**02 Application**

**03 Precondition**

**04 Test Guidance**

**05 Expected Results**

# 01

## Test Environment

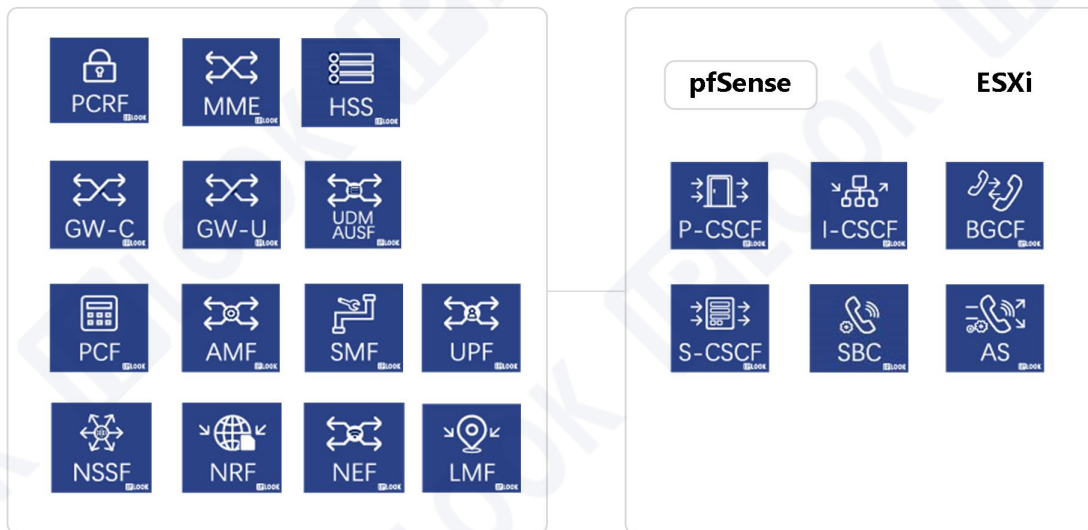

---

# Test Environment

IPLOOK's 4G/5G converged core network has been deployed on the server in New York IDC, and successfully connected with eNodeB/gNodeB based at IPLOOK R&D center, via IPsec tunnel.

Currently, the test environment has been operated stably for over two months, achieving smooth and stable 4G/5G data services and VoNR/VoLTE call.

**Servers in New York IDC**

# 02

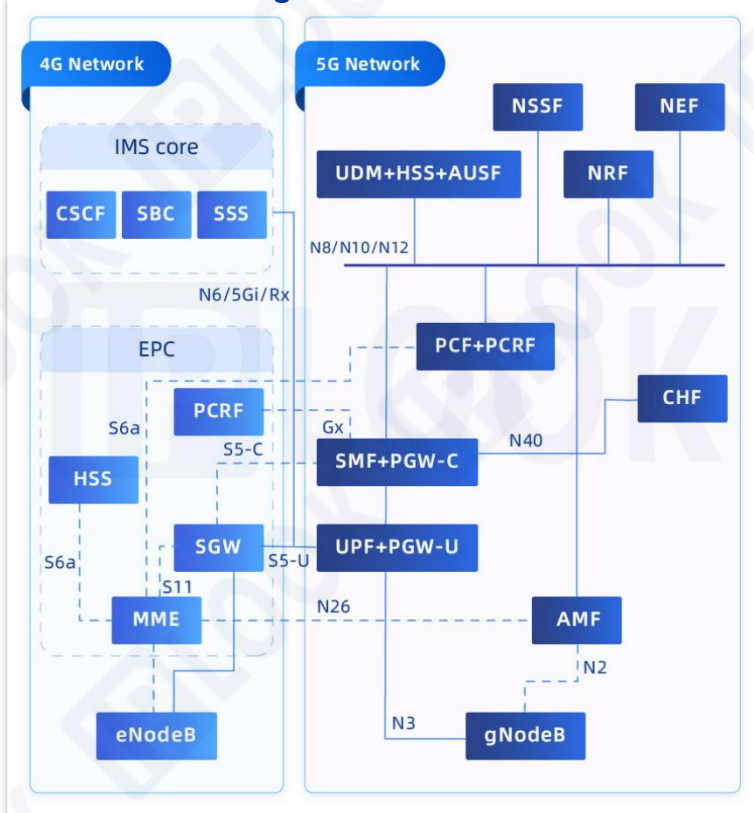

## Application

---

# Application

- The test environment is available for **worldwide potential customer**.
- Connect the base stations with IPLOOK's 4G/5G converged core network in New York IDC to **achieve data, VoLTE/VoNR tests**.
- **Verify the capability** of IPLOOK's mobile core network and the quality of network services.
- **Simple operation** to finish the test with IPLOOK's core network.

## IPLOOK' converged core network

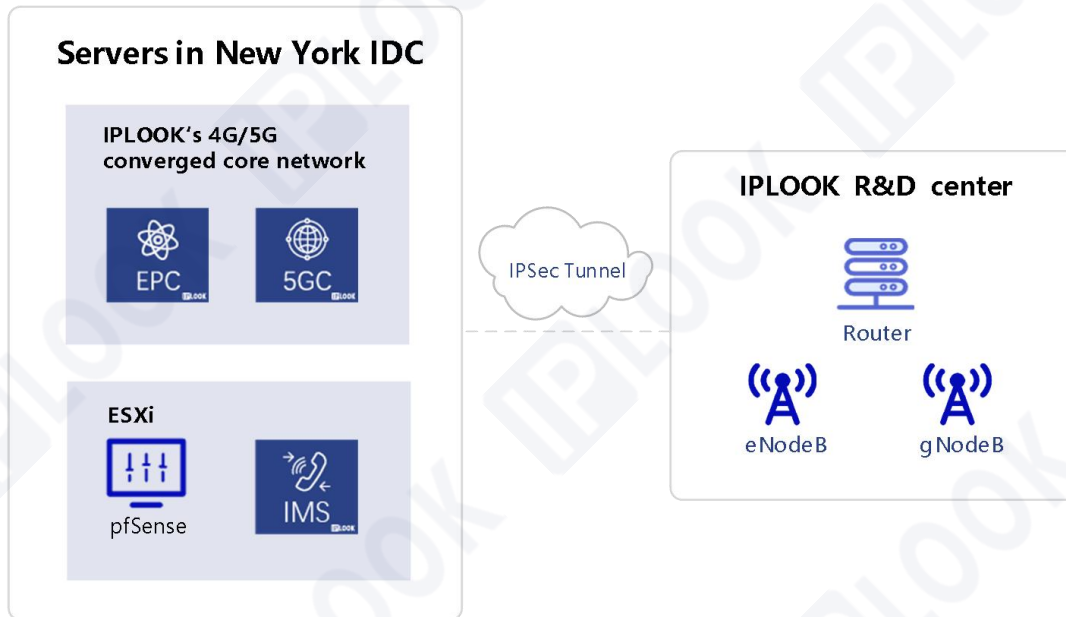

# 03

## Precondition

---

# Precondition

## 3.1 Network Topology

(For differentiation, here pfSense refers to the core network side where the IPsec tunnel is established, and the router refers to the base station side. )

# Precondition

## 3.2 Parameters

With the set up (left side of the IPSec tunnel) of core network and pfSense server, customers need to prepare or confirm the following things for testing.

	Parameters	Note
1	IPSec-enabled router	Or install pfSense system on a server
2	eNodeB/gNodeB	
3	Public IP address	
4	Private IP address	For the IPSec tunnel of the base station side
5	Fixed IP address	On the base station side
6	SIM cards	Blank SIMs
7	Information for SIM card writing	IMSI/KI/OPC
8	PLMN	The one that the customers want to test
9	SMSC Number	For SMS service

# 04

## Test Guidance

---

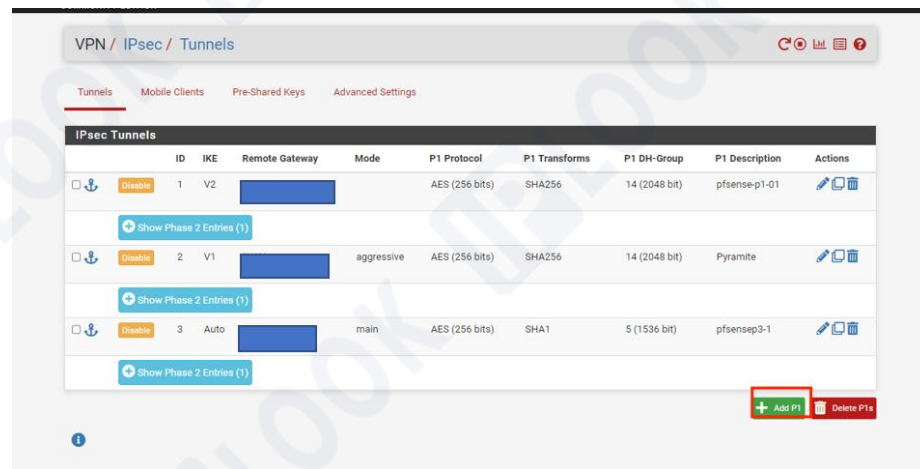

\*Note 1:

- a. The following configurations are for reference only and should be configured flexibly according to the specific situation.
- b. The following screenshots of the OAM interface are for reference only, as the OAM interface varies from different routers and base stations.

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLook)

1. Access to the pfSense management interface via the ip configured on the LAN port after the pfSense installation is completed.
2. Enter IPSec configuration tunnel under VPN option and click on Add P1.
3. The configuration can be done according to the diagram.

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLOOK)

Tunnels Mobile Clients Pre-Shared Keys Advanced Settings

**General Information**

Description   
A description may be entered here for administrative reference (not parsed).

Disabled ☐ Set this option to disable this phase1 without removing it from the list.

IKE ID

**IKE Endpoint Configuration**

Key Exchange version   
Select the Internet Key Exchange protocol version to be used. Auto uses IKEv2 when initiator, and accepts either IKEv1 or IKEv2 as responder.

Internet Protocol   
Select the Internet Protocol family.

Interface   
Select the interface for the local endpoint of this phase1 entry.

Remote Gateway   
Enter the public IP address or host name of the remote gateway.

**Phase 1 Proposal (Authentication)**

Authentication Method   
Must match the setting chosen on the remote side.

Negotiation mode   
Aggressive is more flexible, but less secure.

My identifier

Peer identifier

Pre-Shared Key   
Enter the Pre-Shared Key string. This key must match on both peers.  
This key should be long and random to protect the tunnel and its contents. A weak Pre-Shared Key can lead to a tunnel compromise.  
[Generate new Pre-Shared Key](#)

\*Note:

- Remote Gateway fills in the public IP address of the WAN port on the router side.
- The Authentication Method and Pre-Shared Key should correspond to the configuration on the router side.

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLOOK)

4. The overall configuration is shown in the right diagram.

\*Note: Encryption Algorithm should correspond to the configuration on the router.

The screenshot displays the 'Phase 1 Proposal (Encryption Algorithm)' configuration page in pfSense. The page is divided into several sections:

- Encryption Algorithm:** This section contains four dropdown menus: 'Encryption Algorithm' (set to AES), 'Key length' (set to 256 bits), 'Hash' (set to SHA1), and 'DH Group' (set to 5 (1536 bit)). A 'Delete' button is located to the right of these fields. Below the dropdowns, a note states: 'Note: Blowfish, 3DES, CAST128, MD5, SHA1, and DH groups 1, 2, 5, 22, 23, and 24 provide weak security and should be avoided.'
- Add Algorithm:** A green button with a plus icon and the text 'Add Algorithm' is located below the note.
- Expiration and Replacement:** This section contains four rows, each with a label and a text input field, followed by a descriptive note:
  - Life Time:** Input field contains '28800'. Note: 'Hard IKE SA life time, in seconds, after which the IKE SA will be expired. Must be larger than Rekey Time and Reauth Time. Cannot be set to the same value as Rekey Time or Reauth Time. If left empty, defaults to 110% of whichever timer is higher (reauth or rekey)'.
  - Rekey Time:** Input field contains '25920'. Note: 'Time, in seconds, before an IKE SA establishes new keys. This works without interruption. Cannot be set to the same value as Life Time. Only supported by IKEv2, and is recommended for use with IKEv2. Leave blank to use a default value of 90% Life Time when using IKEv2. Enter a value of 0 to disable.'
  - Reauth Time:** Input field contains '0'. Note: 'Time, in seconds, before an IKE SA is torn down and recreated from scratch, including authentication. This can be disruptive unless both sides support make-before-break and overlapping IKE SA entries. Cannot be set to the same value as Life Time. Supported by IKEv1 and IKEv2. Leave blank to use a default value of 90% Life Time when using IKEv1. Enter a value of 0 to disable.'
  - Rand Time:** Input field contains '2880'. Note: 'A random value up to this amount will be subtracted from Rekey Time/Reauth Time to avoid simultaneous renegotiation. If left empty, defaults to 10% of Life Time. Enter 0 to disable randomness, but be aware that simultaneous renegotiation can lead to duplicate security associations.'
- Advanced Options:** This section contains three rows, each with a label and a dropdown menu:
  - Child SA Start Action:** Dropdown menu set to 'Default'. Note: 'Set this option to force specific initiation/responder behavior for child SA (P2) entries'.
  - Child SA Close Action:** Dropdown menu set to 'Default'. Note: 'Set this option to control the behavior when the remote peer unexpectedly closes a child SA (P2)'.
  - NAT Traversal:** Dropdown menu set to 'Auto'. Note: 'Set this option to enable the use of NAT-T (i.e. the encapsulation of ESP in UDP packets) if needed, which can help with clients that are behind restrictive firewalls.'
- Gateway duplicates:** A checkbox labeled 'Enable this to allow multiple phase 1 configurations with the same endpoint. When enabled, pfSense does not manage routing to the remote gateway and traffic will follow the default route without regard for the chosen interface. Static routes can override this behavior.' is currently unchecked.

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLOOK)

5. The overall configuration of Phase 2 is shown in the diagram on right.
6. Fill the subnet IP on the pfSense side in the Local Network.
7. Fill the subnet IP on the router side in the Remote Network.

General Information	
Description	ipsec02 <small>A description may be entered here for administrative reference (not parsed).</small>
Disabled	<input type="checkbox"/> Disable this phase 2 entry without removing it from the list.
Mode	Tunnel IPv4
Phase 1	pfsense3-1 (IKE ID 3)
P2 reqid	2

Networks	
Local Network	Network: 192.168.1.0 / 24 Type: Address <small>Local network component of this IPsec security association.</small>
NAT/BINAT translation	None / 0 Type: Address <small>If NAT/BINAT is required on this network specify the address to be translated</small>
Remote Network	Network: 172.30.0.0 / 16 Type: Address <small>Remote network component of this IPsec security association.</small>

Phase 2 Proposal (SA/Key Exchange)	
Protocol	ESP <small>Encapsulating Security Payload (ESP) is encryption, Authentication Header (AH) is authentication only.</small>
Encryption Algorithms	<input checked="" type="checkbox"/> AES 256 bits
	<input type="checkbox"/> AES128-GCM Auto
	<input type="checkbox"/> AES192-GCM Auto
	<input type="checkbox"/> AES256-GCM Auto
	<input type="checkbox"/> Blowfish Auto
	<input type="checkbox"/> 3DES

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLOOK)

**Encryption Algorithms** ☒ AES ☐ ChaCha20

<input type="checkbox"/> AES128-GCM	Auto
<input type="checkbox"/> AES192-GCM	Auto
<input type="checkbox"/> AES256-GCM	Auto
<input type="checkbox"/> Blowfish	Auto
<input type="checkbox"/> 3DES	
<input type="checkbox"/> CAST128	

Note: Blowfish, 3DES, and CAST128 provide weak security and should be avoided.

**Hash Algorithms** ☐ MD5 ☒ SHA1 ☐ SHA256 ☐ SHA384 ☐ SHA512 ☐ AES-XCBC

Note: Hash is ignored with GCM algorithms. MD5 and SHA1 provide weak security and should be avoided.

**PFS key group**

Note: Groups 1, 2, 5, 22, 23, and 24 provide weak security and should be avoided.

**Expiration and Replacement**

**Life Time**

Hard Child SA life time, in seconds, after which the Child SA will be expired. Must be larger than Rekey Time. Cannot be set to the same value as Rekey Time. If left empty, defaults to 110% of Rekey Time. If both Life Time and Rekey Time are empty, defaults to 3960.

**Rekey Time**

Time, in seconds, before a Child SA establishes new keys. This works without interruption. Cannot be set to the same value as Life Time. Leave blank to use a default value of 90% Life Time. If both Life Time and Rekey Time are empty, defaults to 3600. Enter a value of 0 to disable, but be aware that when rekey is disabled, connections can be interrupted while new Child SA entries are negotiated.

**Rand Time**

A random value up to this amount will be subtracted from Rekey Time to avoid simultaneous renegotiation. If left empty, defaults to 10% of Life Time. Enter 0 to disable randomness, but be aware that simultaneous renegotiation can lead to duplicate security associations.

**Keep Alive**

**Automatically ping host**

Sends an ICMP echo request inside the tunnel to the specified IP Address. Can trigger initiation of a tunnel mode P2, but does not trigger initiation of a VTI mode P2.

**Keep Alive** ☐ Enable periodic keep alive check

Periodically checks to see if the P2 is disconnected and initiates when it is down. Does not send traffic inside the tunnel. Works for VTI and tunnel.

\*Note: the configuration of Protocol, Encryption Algorithm, Hash Algorithm, and Life Time should be consistent on the both sides of IPSec .

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLook)

8. Add SGi interface of core network as a new gateway.
9. Static Routes: configure the core network address pool as the Destination Network and the S1 IP of the core network as the Gateway. (This configuration is required for internet access.)

The screenshot displays the pfSense web interface, specifically the 'Edit Route Entry' page under 'System / Routing / Static Routes / Edit'. The page has a dark header with navigation links: System, Interfaces, Firewall, Services, VPN, Status, Diagnostics, and Help. Below the header, the breadcrumb trail is 'System / Routing / Static Routes / Edit'. The main content area is titled 'Edit Route Entry' and contains several fields:

- Destination network:** A text input field containing '20.0.0.0' and a dropdown menu showing '/ 8'.
- Gateway:** A dropdown menu showing '192.168.1.2 - 192.168.1.2'.
- Disabled:** A checkbox labeled 'Disable this static route' with the text 'Set this option to disable this static route without removing it from the list.'
- Description:** A text input field with the placeholder text 'A description may be entered here for administrative reference (not parsed).'

At the bottom of the form is a blue 'Save' button.

# Test Guidance

## 4.1 IPSec Configuration on Core Network pfSense (Configured by IPLOOK)

10. Remote access to the core gateway requires to configure port forwarding.

No RDR (NOT) ☐ Disable redirection for traffic matching this rule  
This option is rarely needed. Don't use this without thorough knowledge of the implications.

**Interface** WAN  
Choose which interface this rule applies to. In most cases "WAN" is specified.

**Address Family** IPv4  
Select the Internet Protocol version this rule applies to.

**Protocol** TCP  
Choose which protocol this rule should match. In most cases "TCP" is specified.

**Source** ☒ Display Advanced

**Destination** ☐ Invert match. Single host or alias public IP  
Type Address/mask

**Destination port range** Other 4445 Other 4445  
From port Custom To port Custom  
Specify the port or port range for the destination of the packet for this mapping. The 'to' field may be left empty if only mapping a single port.

**Redirect target IP** Single host 192.168.1.2 EPC IP  
Type Address  
Enter the internal IP address of the server on which to map the ports. e.g.: 192.168.1.12 for IPv4  
In case of IPv6 addresses, it must be from the same "scope",  
i.e. it is not possible to redirect from link-local addresses scope (fe80::) to local scope (::1)

**Redirect target port** HTTP  
Port Custom  
Specify the port on the machine with the IP address entered above. In case of a port range, specify the beginning port of the range (the end port will be calculated automatically).  
This is usually identical to the "From port" above.

**Description**  
A description may be entered here for administrative reference (not parsed).

**No XMLRPC Sync** ☐ Do not automatically sync to other CARP members  
This prevents the rule on Master from automatically syncing to other CARP members. This does NOT prevent the rule from being overwritten on Slave.

**NAT reflection** Use system default

Firewall / Rules / Edit

### Edit Firewall Rule

**Action** Pass

Choose what to do with packets that match the criteria specified below.  
Hint: the difference between block and reject is that with reject, a packet (TCP RST or ICMP port unreachable for UDP) is returned to the sender, whereas with block the packet is dropped silently. In either case, the original packet is discarded.

**Disabled** ☐ Disable this rule  
Set this option to disable this rule without removing it from the list.

**Interface** WAN  
Choose the interface from which packets must come to match this rule.

**Address Family** IPv4  
Select the Internet Protocol version this rule applies to.

**Protocol** Any  
Choose which IP protocol this rule should match.

**Source**

**Source** ☐ Invert match any Source Address /

**Destination**

**Destination** ☐ Invert match any Destination Address /

**Extra Options**

**Log** ☐ Log packets that are handled by this rule  
Hint: the firewall has limited local log space. Don't turn on logging for everything. If doing a lot of logging, consider using a remote syslog server (see the Status: System Logs: Settings page).

**Description**

A description may be entered here for administrative reference. A maximum of 92 characters will be used in the ruleset and displayed in the firewall log.

**Advanced Options** [Display Advanced](#)

\*Note: The outbound and interface policy rules under the firewall need to be set up for release.

\*Note 2:

Due to the different brands and models of routers and base stations, the configuration names may be slightly different, but the parameters to be configured are basically the same. The IPSec configuration can be flexibly changed according to the parameters supported by the router, as long as the configurations on both sides of the IPSec are consistent.

The key configurations are listed below.

## 4.2 Router Configuration for IPSec to Interface with pfSense

- Configured Router Brand/ Model: TP-LINK/ TL-R479GP-AC
- Key Configurations on the Router:
  1. Enter the router management interface, then choose the IPSec management interface under the VPN option to add an IPSec entry;
  2. Fill in the public IP address of the pfSense's WAN port in the peer gateway;
  3. Bind the WAN port where the public IP address used by the router is located;
  4. Fill in the subnet where the local router's LAN port is connected to the base station in the local subnet range;
  5. Fill in the subnet 192.168.1.0/24 of the core network in the peer subnet;
  6. The pre-shared key needs to correspond to the pre-shared key on the pfSense connected to the core network.
  7. Note that the basic settings of the bound WAN port in the IPSec settings are correct.

## 4.3 Base Station Configuration to Connect to the Router and Core Network

- Key Configurations on the Base Station:
  1. Configure the subnet corresponding to the LAN port of the router in the base station;
  2. The router's LAN port is the default gateway of the base station, which is in the same network segment as the base station IP.
  3. Configure s1 IP of core network as service gateway, port 36412 (in 4G application scenario)
  4. Configure PLMN, corresponding to the core network PLMN configuration.
  5. Complete the configuration and confirm that the base station and router can ping successfully.

# Test Guidance

## 4.4 4G/5G Data, VoLTE and VoNR Test on Mobile Phone/CPE

1. Write SIM cards according to the information on the core network.

\*Note:

- a. IMSI/KI/OPC need to be provided for core network for provisioning.
- b. SMSC Number needs to be confirmed with customers for SMS service.
- c. This interface will be different due to the different types of card writing tool. The above are the necessary modification items.
